

## Arrhythmogenic Right Ventricular Cardiomyopathy Panel

**Disorder also known as:** Arrhythmogenic Right Ventricular Dysplasia (ARVD); Uhl Anomaly; Right Ventricular Dysplasia

**Panel Gene List:** *DES, DSC2, DSG2, DSP, JUP, LMNA, PKP2, PLN, RYR2, SCN5A, TGFB3, TMEM43, TTN*

*Additional genes from our cardiology test menu may be added to this panel by selecting test code 483C.*

### Clinical Features:

Arrhythmogenic right ventricular cardiomyopathy (ARVC) is a potentially life-threatening heart muscle disease. It is a disorder of the intracellular desmosomal junctions of cardiomyocytes, responsible for providing and maintaining cell-to-cell adhesion. Cardiomyocyte death and progressive fibrofatty replacement of the right ventricular myocardium are pathognomonic hallmarks of ARVC, which predispose to ventricular tachyarrhythmia and sudden cardiac death (SCD). The disease prevalence is estimated at 1:1000 to 1:2500, but may be higher in certain populations because of non-diagnosed or misdiagnosed cases. Patients with ARVC typically develop symptoms between the second and fifth decade of life (mean age at diagnosis 31 years), but age of onset is widely variable.<sup>1,2</sup>

The most common presenting symptoms of ARVC are heart palpitations, syncope, and SCD. Sometimes, SCD is the first presenting symptom, particularly in young persons and athletes. Many patients may even be asymptomatic and diagnosed only after routine electrocardiogram (ECG). Therefore, disease presentation and severity is also variable. Diagnostic criteria were established by McKenna et al. in 1994 and revised in 2010.<sup>3,4</sup> Diagnosis using these criteria is based on genetic, electrocardiographic, structural, and functional findings.

**Inheritance Pattern/Genetics:** Autosomal Dominant or Autosomal Recessive

### Test Methods:

Using genomic DNA extracted from the submitted specimen, the coding regions and splice junctions of the 13 genes (except for exon 6 for *PKP2*) are enriched using a proprietary targeted capture system developed by GeneDx for next-generation sequencing with CNV calling (NGS-CNV). The enriched targets are simultaneously sequenced with paired-end reads on an Illumina platform. Bi-directional sequence reads are assembled and aligned to reference sequences based on NCBI RefSeq transcripts and human genome build GRCh37/UCSC hg19. After gene specific filtering, data are analyzed to identify sequence variants and most deletions and duplications involving coding exons; however, technical limitations and inherent sequence properties effectively reduce this resolution for some genes. Alternative sequencing or copy number detection methods are used to analyze or confirm regions with inadequate sequence or copy number data by NGS. Reportable variants include pathogenic variants, likely

pathogenic variants and variants of uncertain significance. Likely benign and benign variants, if present, are not routinely reported but are available upon request.

## Test Sensitivity:

The technical sensitivity of sequencing is estimated to be >99% at detecting single nucleotide events. It will not reliably detect deletions greater than 20 base pairs, insertions or rearrangements greater than 10 base pairs, or low-level mosaicism. The copy number assessment methods used with this test cannot reliably detect copy number variants of less than 500 base pairs or mosaicism and cannot identify balanced chromosome aberrations. Assessment of exon-level copy number events is dependent on the inherent sequence properties of the targeted regions, including shared homology and exon size.

Gene	Protein	Inheritance	Disease Association(s)
<i>DES</i>	DESMIN	AD, AR	DCM, ARVC, AV block, myopathy, LGMD
<i>DSC2</i>	DESMOCOLLIN 2	AD, AR	ARVC, ARVC+ skin/hair findings, DCM
<i>DSG2</i>	DESMOGLEIN 2	AD	ARVC, DCM
<i>DSP</i>	DESMOPLAKIN	AD, AR	ARVC, DCM, Carvajal syndrome and related disorders
<i>JUP</i>	JUNCTION PLAKOGLOBIN	AD, AR	ARVC, Naxos disease and related disorders
<i>LMNA</i>	LAMIN A/C	AD, AR	DCM, HCM, ARVC/ARVC-like disease, LMNA-related neuromuscular, lipodystrophy and premature aging disorders
<i>PKP2</i>	PLAKOPHILIN 2	AD	ARVC, BrS
<i>PLN</i>	PHOSPHOLAMBAN	AD	DCM, HCM, ARVC
<i>RYR2</i>	RYANODINE RECEPTOR 2	AD	ARVC, CPVT
<i>SCN5A</i>	SODIUM CHANNEL, VOLTAGE-GATED, TYPE V, ALPHA SUBUNIT	AD, AR	BrS, DCM, ARVC/ARVC-like disease, Heart block, LQTS, SSS, SIDS
<i>TGFB3</i>	TRANSFORMING GROWTH FACTOR, BETA-3	AD	ARVC, Loeys-Dietz syndrome
<i>TMEM43</i>	TRANSMEMBRANE PROTEIN 43	AD	ARVC, EMD
<i>TTN</i>	TITIN	AD, AR	DCM, ARVC, TTN-related myopathies and muscular dystrophies

Abbreviations: AD – Autosomal dominant; AR – Autosomal recessive; ARVC – Arrhythmogenic Right Ventricular Cardiomyopathy; BrS – Brugada Syndrome; RCM – Restrictive Cardiomyopathy; CPVT – Catecholaminergic Polymorphic Ventricular Tachycardia; DCM – Dilated Cardiomyopathy; EMD – Emery Dreifuss Muscular Dystrophy; HCM – Hypertrophic Cardiomyopathy; LQTS – Long QT Syndrome; SSS – Sick Sinus Syndrome; SIDS- Sudden Infant Death Syndrome
